

What you are building

Your task is to create a simple search for photos by a string according to the following base wireframe:

Go

Showing {{n}} of {{total}} results for '{{searchTerm}}'

- The App consumes the [Pixabay Free Images API](#) (you will need to sign up to obtain an API key).
- The UI starts with an empty input field and a 'Go' button
- When the 'Go' button is clicked, the app makes a search for the search term provided by the user
- Each result is displayed in a tile with:
 - Image
 - Author name and avatar if available
 - Tags

How to build it

- Your app should support the major browsers (Chrome, Firefox, Safari, Edge)

- We would encourage that you use a SPA framework
- We would encourage that you use a styling framework
- We would encourage that you build a responsive app

The extra mile (optional)

Although the main outcomes of the task are listed above, feel free to add functionality to make your app more polished. Here is a list of potential enhancements we have come up with:

- Add validation of the input field before submitting
- Handle user pressing 'enter'
- Add a loader while the user waits for the API call to be executed
- Add pagination to the results
- Enhance UI with transitions
- Write tests

Happy coding!!!
